API ON-STREAM INSPECTORS

PK Technology is a full-service inspection contractor that provides intelligent solutions through industry-leading methodologies and enterprise-level mobile technology designed to keep projects on budget, on schedule, and safe.

An API on-stream inspector **(API 510, 570, 653)** provides each client with a full API-based inspection of their in-service piping and equipment. This service will typically include NDE services to assist in inspection data gathering. Positive Material Identification (PMI) programs can be implemented to ensure correct material is in place per the applicable specfication.

By utilizing intelliSPEC™, our inspectors are more productive, allowing for virtual real-time uploading into the client's legacy database - often much eariler than typical. PK Technology can monitor the process remotely and any erroneous or suspect data is automatically highlighted. The suspect data is then communicated to the inspector to take additional readings and investigate further. The resulting finished product has been reviewed, validated and prepared in load sheets, ready to upload into the legacy database within a few days - if not hours of the job completion.
